Horizontal Site Prompt — SEO/GEO/Local-Optimized Version

Prompt Instructions

Paste URLs: Copy the links to the client's Home, Services, About, Gallery, Reviews, Contact, and **Google Business Profile** pages. Paste them into the SOURCE URLs section. Delete any lines for pages they don't have.

Fill Missing Info: Only type in the Manual Fields if the website is missing info (like a phone number, license, or business hours). Delete any blank fields you don't need.

New in this version: This prompt now generates a site that is crawlable and indexable despite the horizontal-scroll layout, carries full local-SEO/NAP and schema markup, includes an FAQ panel written for AI answer engines (ChatGPT, Perplexity, Google AI Overviews), and embeds a real Google Map tied to the client's Business Profile.

The Prompt

PRIORITY 1: Extract data from the Source URLs provided. **PRIORITY 2:** If data is missing, use the Manual Backup Fields. **PRIORITY 3:** SEO, GEO (AI/generative search), and Google Maps/local-pack signals must be implemented on every panel — not bolted on afterward. Treat discoverability as a design constraint equal to visual polish.

COPYWRITING RULE: Elite Direct-Response Transformation

Do NOT simply copy-paste text from the source URLs. Rewrite all scraped content (Services, About, Benefits, FAQ) using these principles:

- **Focus on Pain Points:** Highlight the customer's fear of a failed project, wasted money on DIY attempts, the stress of unreliable providers, or the loss of value/time.
- **Power Words:** Engineered, Transformed, Impeccable, Sanctuary, Instant Value, Hassle-Free, Guaranteed, Seamless.
- **Tone:** Authoritative yet empathetic. Position the business as the expert who saves the client time, protects their investment, and eliminates risk.
- **Structure:** Every section must move the reader from "Problem" to "Solution" to "Proof."

- **SEO/GEO overlay:** Every rewritten section must still contain the primary keyword (service + city), a factual/specific claim (a number, credential, or timeframe), and at least one sentence that could stand alone as a direct answer to a search query. Marketing flourish should wrap around facts, never replace them — AI answer engines and Google both discount pure adjective-stacking with no verifiable content.

SOURCE URLs (PASTE LINKS HERE IF AVAILABLE)

- **Home Page URL:** [PASTE LINK OR DELETE]
- **Services / Products Page URL:** [PASTE LINK OR DELETE] *(Look for: core offerings, packages, pricing tiers)*
- **About Us Page URL:** [PASTE LINK OR DELETE] *(Look for: mission, history, team bios, credentials)*
- **Gallery / Portfolio Page URL:** [PASTE LINK OR DELETE] *(Look for: case studies, before/afters, project photos)*
- **Reviews / Testimonials Page URL:** [PASTE LINK OR DELETE] *(Google, Yelp, Facebook, Trustpilot)*
- **Contact Page URL:** [PASTE LINK OR DELETE]
- **Privacy Policy / Terms URL:** [PASTE LINK OR DELETE]
- **Google Business Profile / Google Maps Listing URL:** [PASTE LINK OR DELETE] *(critical for NAP match, map embed, geo coordinates, and star-rating schema)*
- **Existing Sitemap URL (if any):** [PASTE LINK OR DELETE]

MANUAL BACKUP FIELDS (ONLY FILL IF URL IS MISSING/UNAVAILABLE)

Core business info

- Business Name: [INSERT NAME]
- Tagline / Slogan: [INSERT TAGLINE OR DELETE]

- Service Area (City/Region): [INSERT CITY OR DELETE]
- Additional Service Areas / Neighboring Cities Served: [INSERT LIST OR DELETE] *(feeds areaServed schema + local content)*
- Phone Number: [INSERT PHONE OR DELETE]
- Email Address: [INSERT EMAIL OR DELETE]
- Physical Address: [INSERT ADDRESS OR DELETE]
- GPS Coordinates (lat, long): [INSERT OR DELETE] *(pull from Google Business Profile if unknown)*
- Business Hours (per day): [INSERT HOURS OR DELETE]
- License / Certification Numbers: [INSERT INFO OR DELETE]
- Insurance Info: [INSERT INFO OR DELETE]
- Years in Business: [INSERT YEARS OR DELETE]
- Certifications / Awards: [PASTE AWARDS OR DELETE]
- Brand Colors (Hex Codes): [INSERT HEX CODES OR DELETE FOR DEFAULT DARK BLUE/WHITE]
- Key Services / Offerings List: [PASTE LIST OR DELETE]
- Top 3 Testimonials: [PASTE TESTIMONIALS OR DELETE]

SEO / GEO targeting

- Primary Target Keyword (service + city, e.g. "roof replacement Kansas City"): [INSERT OR DELETE]
- Secondary Keywords (3–5): [INSERT LIST OR DELETE]
- Top 5 Customer Questions (for FAQ panel — pull from real calls/emails if possible): [INSERT LIST OR DELETE]
- Unique Selling Proposition in one sentence: [INSERT OR DELETE]

SOCIAL & EXTERNAL LINKS (PASTE URLS OR DELETE)

- Facebook URL: [PASTE LINK OR DELETE]
- Instagram URL: [PASTE LINK OR DELETE]
- LinkedIn URL: [PASTE LINK OR DELETE]
- Google My Business URL: [PASTE LINK OR DELETE]
- Industry-Specific Profile (Houzz, BBB, Healthgrades, Angi, etc.): [PASTE LINK OR DELETE]
- YouTube / Video Testimonials URL: [PASTE LINK OR DELETE]

IMPLEMENTATION LOGIC

1. **Scrape First:** Attempt to extract all text and images from the provided URLs.
2. **Rewrite:** Apply the "Elite Direct-Response" rules above to the scraped text, preserving factual/keyword content per the SEO/GEO overlay. Do not output raw scraped text.
3. **Fallback:** If a URL is missing or scraping fails, use the corresponding Manual Backup Field. If that field is also empty, generate professional, industry-appropriate placeholder copy based on the Business Name and Industry — but never fabricate a license number, certification, address, or star rating. Leave those blank or clearly marked "[ADD CLIENT LICENSE #]" rather than inventing one.
4. **Images:** Prioritize images scraped from the Portfolio/Gallery and Hero sections. If none exist, use high-quality, generic industry-relevant stock images or CSS gradients — never a fabricated "photo of the team" claim.

STEP 2: CRITICAL ARCHITECTURE — Vertical-to-Horizontal Mapping

Do NOT use overflow-x: hidden on a wide container. Implement the following:

- **Scroll Track:** Main wrapper div with height: [number of panels × 100vh]. Creates vertical scroll distance.
- **Sticky Viewport:** Inside the wrapper, a container with position: sticky; top: 0; height: 100vh; overflow: hidden;. Locks the screen.

- **Horizontal Strip:** Inside the sticky container, a display: flex; flex-direction: row container holding all panels (each min-width: 100vw; height: 100vh).
- **Scroll-Binding Script (Vanilla JS):** Listen to window.scrollY. Calculate progress = scrollY / (document.body.scrollHeight - window.innerHeight). Apply transform: translateX(-${progress * (panelCount - 1) * 100}%) to the horizontal strip.
- **Result:** User scrolls down normally — content moves horizontally.

SEO-critical note: All panel content (headings, paragraphs, service lists, testimonials, FAQ) must exist as real, present-in-the-DOM HTML on initial page load — never injected only on scroll/intersection or fetched via a later API call. Google's renderer and most AI crawlers execute JS but budget rendering time; content that only appears after a scroll-triggered fetch risks not being indexed. Horizontal transform is a *visual* effect only — it must never gate content visibility from the crawler.

STEP 3: NAVIGATION

- **Sticky Header:** Fixed position: fixed; top: 0; width: 100%; z-index: 1000;
- **Style:** Semi-transparent dark background with backdrop blur. White text. Clean, minimal.
- **Links:** Auto-generate one link per panel, labeled by section name (Home, Services, About, Reviews, FAQ, Contact).
- **Active State:** Script detects which panel is currently centered and highlights its corresponding nav link.
- **Click Behavior:** Clicking a nav link smoothly scrolls the page to position that panel in the viewport, and updates the URL hash (#services, #about, etc.) so each section is a linkable, shareable, bookmarkable anchor — this also gives AI answer engines and Google a way to deep-link to a specific section.
- **Branding:** Display the business name as text in the left side of the nav bar. If a logo image was scraped, display it (with descriptive alt text including the business name).

STEP 4: ANIMATION & TRANSITIONS

- **Element Exit:** As a panel leaves the viewport to the left, foreground elements transition to translateX(-10%) scale(0.95); opacity: 0.
- **Element Entrance:** As a panel enters from the right, elements animate from translateX(100%); opacity: 0 to translateX(0); opacity: 1 with staggered delay and cubic-bezier easing.
- **Background Morphing:** Each panel has a full-screen background. Cross-fade between backgrounds based on scroll progress using opacity transitions tied to scrollProgress.
- **Mobile:** Set touch-action: pan-y so vertical swipe gestures trigger horizontal movement. Ensure snap points align with screen width.
- **Performance guardrail:** Animate only transform and opacity (GPU-accelerated, non-layout-triggering properties) so Core Web Vitals — specifically Cumulative Layout Shift (CLS) and Interaction to Next Paint (INP) — stay clean. Layout-shifting animations directly hurt Google ranking signals.

STEP 5: PANEL STRUCTURE & CONTENT MAPPING

Generate the following panels as semantic HTML5 (<header>, <nav>, <main>, one <section> per panel with a descriptive id and aria-label, <footer>). Populate each with content scraped from the client's site or, if unavailable, generate professional copy based on the manual inputs.

Panel 1 — Hero / Homepage

- **Purpose:** First impression, core value proposition, primary call to action.
- **Elements:** <h1> headline (must contain primary keyword + city, appears only once on the page), subheadline, primary CTA button, hero background image with descriptive alt text.
- **Scrape Target:** Homepage hero section, tagline, main headline.
- **Fallback:** Generate headline from business name + core service + USP + city.

Panel 2 — Services / What We Do

- **Purpose:** Detail the offerings.
- **Elements:** <h2> section headline, service cards (icon + <h3> title + description), supporting image.
- **Scrape Target:** Services page, "What We Do" section, menu of offerings.
- **Fallback:** Generate service cards from the manual services list with professional descriptions based on industry norms.
- **SEO note:** Each service card description should naturally include a secondary keyword and the service area.

Panel 3 — About / Why Us

- **Purpose:** Build trust and differentiate (this panel carries the most E-E-A-T weight for both Google and AI answer engines).
- **Elements:** <h2> headline, company story, key differentiators/values list, team photo, and visible credentials (years in business, license #, certifications) rendered as plain text, not just in an image.
- **Scrape Target:** About page, "Why Choose Us" section, team section.
- **Fallback:** Generate a professional about section from the business name, industry, USP, and any manual credential fields provided.

Panel 4 — Testimonials / Social Proof

- **Purpose:** Validate through third-party credibility.
- **Elements:** <h2> headline, 3 testimonial cards (quote + customer name), visible star ratings, award/trust badges.
- **Scrape Target:** Testimonials page, reviews section, Google/Yelp review content.
- **Fallback:** Generate realistic placeholder testimonials appropriate to the industry, clearly labeled as illustrative examples in an HTML comment (never marked up with Review schema unless the testimonials are real — see Step 6).

Panel 5 — FAQ *(new panel — built for GEO/AI answer engines)*

- **Purpose:** Directly answer the questions people ask Google, ChatGPT, Perplexity, and Google's AI Overviews about this business/service.

- **Elements:** <h2> "Frequently Asked Questions," 5–8 question/answer pairs using real <h3> questions and concise (40–60 word) direct-answer paragraphs. Lead with the answer, then add supporting detail.
- **Source:** Manual "Top 5 Customer Questions" field, or generate industry-standard questions (pricing range, timeline, service area, licensing, what makes them different) if none provided.
- **Why it matters:** Short, self-contained Q&A blocks are what generative search engines extract verbatim to build AI answers and citations — this panel is the single highest-leverage section for GEO.

Panel 6 — Contact / Get Started

- **Purpose:** Convert interest into action.
- **Elements:** <h2> headline, contact form (Name, Email, Phone, Message), business phone number, email, physical address, operating hours, and a **live Google Maps embed** (see Step 8) — not a placeholder graphic.
- **Scrape Target:** Contact page, footer info, embedded map data, Google Business Profile.
- **Fallback:** Use manual contact details. Generate form with a generic professional headline ("Get in Touch" / "Request a Free Quote").
- **NAP consistency:** The Name, Address, and Phone number in this panel must be byte-for-byte identical to what's on the client's Google Business Profile — mismatches are one of the most common causes of local-pack ranking loss.

STEP 6: STRUCTURED DATA / SCHEMA MARKUP *(new)*

Inject the following JSON-LD into the <head>, populated from scraped/manual data. Never fabricate values — omit a schema property entirely rather than guessing at a rating, address, or number.

- **LocalBusiness** (or the more specific subtype — RoofingContractor, Plumber, Dentist, etc.) with name, address (PostalAddress), geo (GeoCoordinates),

telephone, openingHoursSpecification, areaServed, url, image, and sameAs (array of the social/profile URLs collected above).

- **AggregateRating + Review** nested under the LocalBusiness — only if real review data was scraped or provided. Do not synthesize ratings from placeholder testimonials.
- **FAQPage** with mainEntity matching the exact questions/answers used in Panel 5, word-for-word.
- **BreadcrumbList** reflecting the single-page section anchors (Home > Services > About > Reviews > FAQ > Contact).
- **Organization** with logo and sameAs social links, if the LocalBusiness type doesn't already cover branding needs.

Validate mentally against Google's Rich Results structure before finalizing — every required property for the chosen type should be present.

STEP 7: ON-PAGE & TECHNICAL SEO *(new)*

- **<title>:** "[Primary Service] in [City] | [Business Name]" — under 60 characters.
- **Meta description:** 150–160 characters, includes primary keyword, city, and a call to action.
- **Canonical tag:** self-referencing canonical URL.
- **Open Graph + Twitter Card tags:** og:title, og:description, og:image (use the strongest hero/gallery image), og:type=business.business, twitter:card=summary_large_image.
- **Heading hierarchy:** exactly one <h1> (Panel 1), <h2> per panel section, <h3> for sub-items (services, FAQ questions). Never skip levels.
- **Alt text:** every image gets specific, keyword-aware alt text (e.g., alt="Completed kitchen remodel in Overland Park, KS by [Business Name]"), never generic alt="image1".

- **<noscript> fallback:** provide a basic static, linearized (vertically stacked) version of all panel content inside <noscript> tags so the page degrades gracefully and remains fully readable for any crawler or browser that doesn't execute JS.
- **robots.txt / sitemap.xml:** generate a minimal sitemap.xml listing the page URL with its section anchors, and confirm nothing in robots.txt blocks crawling.
- **Page speed:** inline critical CSS for above-the-fold Panel 1, defer non-critical JS, lazy-load images below the fold (loading="lazy") except the Panel 1 hero image (load eagerly to protect Largest Contentful Paint).

STEP 8: GOOGLE MAPS & LOCAL-PACK OPTIMIZATION *(new)*

- **Live map embed:** In Panel 6, embed an actual Google Maps iframe centered on the client's verified address/coordinates (pulled from the Google Business Profile URL) — not a static image or generic placeholder pin.
- **NAP consistency:** Name, Address, Phone must match exactly (formatting included) across the site footer, Contact panel, schema markup, and the Google Business Profile.
- **areaServed schema:** list every city/neighborhood the manual "Additional Service Areas" field specifies, so the business can surface for nearby-city searches, not just its home city.
- **Click-to-call:** phone number is a real tel: link on both desktop and mobile.
- **Directions link:** "Get Directions" CTA link that opens Google Maps directions to the verified address.
- **Local keyword placement:** the service area city/region should appear naturally in the H1, at least one H2, the meta title, meta description, and image alt text — not stuffed, just present where it's editorially natural.

STEP 9: TECHNICAL CONSTRAINTS

- **Zero Dependencies:** Pure HTML, CSS, and Vanilla JavaScript only.

- **Dynamic Panel Count:** The scroll track height must automatically adjust if fewer or more than 6 panels are generated (e.g., 5 panels = 500vh).
- **Performance:** Use will-change: transform and translate3d() for GPU-accelerated rendering. Throttle scroll event listeners with requestAnimationFrame.
- **Accessibility:** Proper heading hierarchy, alt text on all images, keyboard-navigable focus states, visible focus outlines, and aria-labels on nav links and section landmarks. Accessibility signals overlap heavily with both traditional SEO and GEO crawlability.
- **Responsiveness:** On mobile (< 768px), horizontal scroll still functions via touch, nav collapses to a hamburger menu, text sizes scale appropriately, and the Google Maps embed remains tappable/scrollable without trapping the page scroll.
- **Crawlability check (final step before delivery):** Confirm that viewing page source (not just DevTools-rendered DOM) shows the full text content of every panel. If content only appears after JS execution and is not present in initial HTML, restructure so it's server-rendered/static in the markup and only *visually* repositioned by the scroll-binding script.
